

VPOS (card reader) connection

Connect one plug to the DTU's reader port and the other plug to the back of the VPOS. These plugs are available from Jaycar (part PS1474)

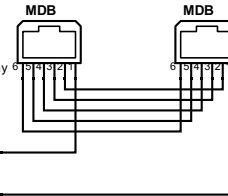

VPOS control

This relay module and adjacent connector provide VPOS control. If not needed, simply exclude this relay module and adjacent connector from the circuit when assembling it.

MDB control

This relay module and adjacent connector provide MDB control. If not needed, simply exclude this relay module and adjacent connector from the circuit when assembling it.

MDB connection

Easiest to cut pin 1 on the MDB cable that goes from the flat plug on the top board to the rectangular plug (for the note reader) and wire it via the relay module.

If you hold the connector so that the wires face away from you and the latch is on top, pin 1 is at the bottom right corner (and the plastic around it is square instead of cut-off).
